Original publisher: Cleveland, Ohio : National Aeronautics and Space Administration, Glenn Research Center, 2005 OCLC Number: (OCoLC)696011806 Excerpt: . . . 1. SiC has a critical electric field of about 10 times or more ( depending on polytype ) compared to Si. This advantage results in higher device breakdown voltage capability and thus drift regions and voltage hold-off layers can be thinner. SiC device die are thinner because of the above advantage of high breakdown voltage. Thinner die mean 2. lower on-state resistance. 3. SiC can have higher doping, again because of the higher breakdown voltage capability. This situation also leads to lower on-state resistance and lower conduction losses and, therefore, higher efficiency. 4. SiC has a thermal conductivity almost 2 times greater than Si. This gives a lower junction-to-case thermal resistance because heat is more easily conducted from the device junction ( s ) with a resultant decrease in temperature rise. SiC can operate at high temperature because of its wider bandgap and thus reduces or possibly eliminates 5. the need for external cooling. The present consensus seems to be that SiC devices will be used in a large number of applications once they become commercially available. Presently the only commercially available SiC devices are Schottky diodes and Cree ( ref. 29 ), Infineon Technologies AG ( ref. 30 ), Microsemi ( ref. 31 ), and Solid State Devices ( ref. 32 ) have a product line for these devices. The introduction of other SiC devices such as power switches into the commercial market will require the resolution of many technical issues including material quality, contacts, SiC oxide interface, passivation, and packaging. In SiC materials the presence of device-killing defects such as micropipes as well...
