Frequently, spectral characteristics for the dielectric and magnetic properties that differ from those of individual constituent materials are needed. Hence it is necessary to produce a material whose electromagnetic properties follow some specified behavior. This may be accomplished by either loading a material or by making multiphase mixtures. The loading constituent may take the form of small spheres, ellipsoids, platelets, rods, or other shapes. The bulk properties of the composite will depend on the alignment of the loading particles and therefore may be dielectrically or magnetically anisotropic. The loading particles may also interact with each other. Thus, the size, shape, and alignment of the loading material particles enter into mathematical formalisms describing the electromagnetic behavior. Effective medium theory has been studied for many years [1 In this paper we evaluate the applicability of coupled electric and magnetic - field integral equation solutions for the effective propagation constant and impedance of a two-phase mixture that is modelled by a uniform lattice of spheres embedded in a matrix In the formalism the spherical loading particles and matrix may have any dielectric or magnetic properties. The inclusions may be electrically and magnetically penetrable or nonpenetrable. For example, porosity in a polycrystalline ceramic or expanded polymer may be modeled by lossless inclusions whose relative permittivity is unity. Similarly, the microscopic structure of various metal glasses, colloidal solutions, and metallic films may be modeled by nonpenetrable metallic inclusions. Calculated dielectric and magnetic properties corresponding to certain assumed microstructures may be compared with those observed in laboratory measurements. In the...
