AIDS and Pancreas in the HAART Era A Cross Sectional Study

By Ethel Chehter

LAP LAMBERT Academic Publishing. Paperback. Condition: New. 76 pages. Dimensions: 8.7in. x 5.9in. x 0.2in. This study aims to identify the main morphological patterns of pancreas in AIDS patients using Highly Active Antiretroviral Therapy (HAART). We compared adults who died of AIDS using HAART and underwent autopsy with 109 AIDS patients without HAART therapy. The HAART group presented lighter pancreatic abnormalities than non-HAART users. In the HAART group, histology shows: reduction of zymogen granules in the acinar cells (ZG), lower dysplasia-like and higher pancreatic acinar atrophy. The exocrine pancreas in treated patients was distinguished by the high level of atrophy, sharp reduction of zymogen granules and high level of apoptosis, reflecting degeneration and lower level of protein-caloric malnutrition. The islets of Langerhans in the HAART group were increased in number and volume and with a high level of nuclear dysplasia. The antiretroviral therapy and a longer survival resulted in higher atrophy and reduction of enzymes, increasing the apoptosis and generating important changes in the pancreatic islets, probably resulting in clinical-laboratory repercussions. We found no evidence of pancreatic histological lesions secondary to antiretroviral therapy. This item ships from multiple locations. Your book may arrive from Roseburg, OR, or La Vergne, TN. Paperback.

Reviews

Simply no terms to explain. I am quite late in starting reading this one, but better than never. It has been written in a remarkably easy way and is particularly mererly soon after I finished reading this book where basically changed me, affect the way I really believe.

-- Prof. Jedediah Kuhic DVM

Without doubt, this is actually the very best function by any article writer. It was written quite flawlessly and valuable. Once you begin to read the book, it is extremely difficult to leave it before concluding.

-- Prof. Isobel Heller MD
